

ARGONNE NATIONAL LABORATORY

December 7, 1973

Professor Alan Hindmarsh
Lawrence Livermore Laboratory
P.O. Box 808
Livermore, California 94550

Dear Alan:

Recent telephone conversations with you and others have encouraged us to proceed with plans for the ODE Software Workshop. It appears that the week of June 3 is acceptable to everyone. "Mathematical Software II" at Purdue is the week before. Whether we schedule 4 or 5 days is open to discussion and I solicit your comments. We won't exhaust the subject in 5 days, but I'm not sure about the participants.

The objective of the workshop can be simply stated though its accomplishment will tax our capacities both as scientists and as diplomats.

Objective: Define the capability and user interface of a systematized collection of routines for solving ordinary differential equations. Propose the contents of the collection which would achieve that capability.*

This is no abstract exercise. The NATS project is interested in coordinating the preparation, field testing and distribution of an ODE package but there are two kinds of reasons why this is a more formidable task than the creation of EISPACK. First, it is clear that there is far less general agreement about the nature of such a package. Second, collaboration with other institutions must include work at the code development level since Argonne cannot claim the kind of expertise in ODE software that we have in other software areas. While the identification of these institutional issues is not explicitly listed as an objective of the workshop I hope we can make a start on deciding how we might work together.

I invite each of you to nominate one or two of your colleagues to attend the workshop with you. We are especially eager to involve people who are experienced in software development and who are aware of the problems involved in creating multisystem programs.

The Laboratory will reimburse the participants for round-trip tourist class airfare from their usual place of business to Chicago, lodging and local transportation. In addition, a per diem of \$13 per day will cover meals and incidentals.

*We use the term "systematized collection" as in Smith, B.T., Boyle, J.M., and Cody, W.J., The NATS Approach to Quality Software, to appear as Chapter 23 in the Proceedings of the Loughborough Conference.

Professor Alan Hindmarsh

December 7, 1973

but I'm willing to stay the full week if everyone else is. It may be a painful day or two before we come to understand each other and tolerate our mutual differences of opinion in a professional manner. But thereafter, with a generous dose of the spirit of compromise, I think we can go a long way toward the stated objective.

I will be eager to hear more about plans for the workshop when they have jelled. Also, I would appreciate your advice about inviting Fred Fritsch as soon as possible.

Very sincerely,

ACH/csm

A.C. Hindmarsh

POSSIBLE TOPICS

1. Problem domain
 - a) Initial value vs. boundary value problem
 - b) Stiff vs. nonstiff
 - c) 1st order vs. higher order equations
 - d) Expensive vs. inexpensive $f(y,t)$ ($=\dot{y}$)
 - e) Expensive vs. inexpensive higher derivatives
 - f) Specialized versions: differential-algebraic and implicit systems, banded or sparse Jacobian

2. Code sources
 - a) Existing code candidates
 - b) Unimplemented algorithm candidates

3. Programming standards
 - a) Standards for EISPACK
 - b) Call sequences
 - c) Use of Common
 - d) Modular structure

4. Testing
 - a) Test problem sets
 - b) Independent test centers

5. Funding
 - a) Code development needs
 - b) Testing needs
 - c) Site selection

6. Name : ODEPACK?

ARGONNE NATIONAL LABORATORY

Dr. Fred N. Fritsch
Lawrence Livermore Laboratory
University of California
P.O. Box 808, L-63
Livermore, California 94550

Dear Fred:

I was pleased to have a suggestion from Alan Hindmarsh that you attend the ODE Software Workshop at Argonne next June 3 - 7. I shall assume that Alan has discussed the workshop with you so that you are aware of our objectives. Although much of the workshop's work will focus rather particularly on differential equations, we do want to consider questions of standards, portability, and the related software engineering; and I shall attempt to arrange the agenda so you can participate in those discussions and will have the freedom to use your time at Argonne in conversations with Lyness and Cody and others when workshop turns to nitty-gritty that may be outside your interests. As Jim Pool has suggested, we wanted to attract you to Argonne for the latter purposes anyway, and may as well capitalize on this opportunity.

It seems likely that Brian Ford will attend the workshop and participate in the same discussions that would particularly interest you. I certainly hope you will plan to attend.

The Laboratory will reimburse the participants for round trip tourist class air fare from their usual place of business to Chicago, lodging and local transportation. In addition, a per diem of \$13 per day will cover meals and incidentals.

I will be writing to you very shortly concerning our plans for NATS II.

Cordially,

Wayne Cowell
Applied Mathematics Division

Professor George Byrne
Department of Mathematics
University of Pittsburgh
Pittsburgh, Pennsylvania 15213

Dear Professor Byrne:

Alan Hindmarsh has suggested that you attend the ODE Software Workshop at Argonne next June 3 - 7. We are delighted with this suggestion, and I extend to you a cordial invitation to participate.

Perhaps Alan has discussed the workshop with you, so you are likely aware of our objectives. Our purpose is to define the capability and user interface of a systematized collection* of routines for solving ordinary differential equations. We also hope to propose the contents of the collection which would achieve that capability.

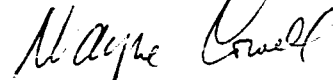

You may have heard of the NATS project which has been concerned with carrying out the systematization process for certain classes of codes notably an Eigensystem package called EISPACK and a special function package called FUNPACK. An important function of the NATS project activities is field testing in which Lawrence Livermore Laboratory has participated in a significant way. The project is interested in coordinating the preparation, field testing, and distribution of an ODE package, but there are two kinds of reasons why this is a more formidable task than was the creation of EISPACK. First, it is clear that there is far less general agreement about the nature of such a package. Second, collaboration with other institutions must include work at the code development level since Argonne cannot claim the kind of expertise in ODE software that we have in other software areas. While the identification of these institutional issues is not explicitly listed as an objective of the workshop, I hope we can make a start on deciding how we might work together.

*We use the term "systematized collection" as in Smith, B.T., Boyle, J.M., and Cody, W. J., The NATS Approach to Quality Software, to appear as Chapter 23 in the Proceedings of the Loughborough Conference.

The Laboratory will reimburse the participants for round-trip tourist class air fare from their usual place of business to Chicago, lodging and local transportation. In addition, a per diem of \$13 per day will cover meals and incidentals.

We are looking forward to your attendance and will in the meantime welcome your suggestions about topics to be covered. I understand that we already have input from you reflected in the list of topics in Alan's recent letter. Because of your Engineering connections you may be able to offer insight from the User community which would be very valuable.

Yours very truly,

Wayne Cowell

Date: April 2, 1974
To: Participants in ODE Software Workshop
From: Wayne Cowell *Wayne Cowell*

Attached is a list of participants in the ODE Software Workshop. We are now working on an agenda that will occupy 4 full days, June 3 - 6, with Friday morning, June 7, left open for ad hoc continuation of unfinished business.

At this early stage of agenda preparation I propose that we spend approximately one day each on the following general topics:

1. The capabilities of an ODE package;
2. The content and structure of an ODE package;
3. Testing ODE software;
4. Modes of collaboration.

To stimulate your thinking in these areas I have attached a list of topics that Alan Hindmarsh and George Byrne constructed and a list of leading questions I put together. I am inviting each of the participants to begin collecting his thoughts and assembling program write-ups, reports, etc. that address these questions.

In 3-4 weeks I will be calling to discuss topics of particular concern to you and to work out ways of covering your interests adequately. In the meantime I suggest that you circulate to all participants, with a copy to me, any reports or comments you feel should be studied prior to the meeting. I expect to circulate some thoughts on question 6 (organization and funding).

We will ask for your travel plans later so we may make local arrangements.

ODE SOFTWARE WORKSHOP

Argonne National Laboratory

June 3 - 7, 1974

Questions for Consideration

1. Assume that the current level of effort in ODE software remains essentially constant over the next 5 years and that duplication of effort is minimal. What capabilities should ODE software possess in 1979?
2. Shorten the time to two years so that only software that exists or is in an advanced stage of completion can be considered. What capabilities could be exhibited by ODE software in 1976?
3. If the 1976 software could be assembled into a systematized collection (analogous to EISPACK) what capabilities do you see as having high, moderate, and low priority? (See Hindmarsh-Byrne Topic 1.)
4. What existing or proposed codes embody the capabilities of question #3? (See Hindmarsh-Byrne Topic 2.)
5. What programming conventions should be required or recommended? Shall the requirements apply to existing software thus implying restructuring or, at least, reformatting of existing code? Are the conventions you suggest adequate to insure that code written by different people in different places can be merged into a single package? (See Hindmarsh-Byrne Topic 3.)
6. How should an effort to create a package as in question #3 be organized and funded? (Note: Here "create" includes assembly of code from various sources into a coherent collection, carrying out testing procedures, disseminating and supporting the package. This question probes the relationship of the ODE effort to existing efforts.) (See Hindmarsh-Byrne Topics 4, 5.)

TO: Participants in the ODE Software Workshop,
June 3-7, 1974

FROM: Wayne Cowell *Wayne Cowell*

SUBJECT: Collaboration and Systematized Collections

Suppose that, as a result of discussions among leaders in the field, there emerges a consensus as to the capabilities of an ODE software package and agreement, at least tentatively, on existing codes which implement that capability. What, then, is the nature of the process through which various groups can work together to use such codes as raw material for the creation of a coherent package? In my memo of April 2 I promise some remarks on this central question. Such remarks are necessarily very general at this time but, as a preliminary to discussions during the workshop, I would like to outline the structure of an ODE software task force and to indicate the role that Argonne might play.

In earlier correspondence I referred to a paper that Brian Smith, Jim Boyle, and Jim Cody gave at the Loughborough Conference last year. The proceedings of that conference will appear as Software for Numerical Mathematics, D. J. Evans, ed., Academic Press, 1974. Since the book has not yet appeared, I have enclosed a copy of the paper. It does not deal explicitly with organization, but it offers a description of *systematized collections* which can be translated into an organizational approach to the creation of such collections.

For individual mathematical routines the paper describes the "quality attributes": reliability, robustness, structure, usability, validity. It then gives meaning to these same attributes for collections of routines and defines a systematized collection to be a set of subroutines which collectively solve a wide spectrum of problems and which possess the quality attributes as individuals and as a collection. The discussion in the paper is essential to an understanding of the NATS usage of these terms, but let me present the following summary for reference:

Reliability is the ability of a subroutine or package to perform a well-defined calculation accurately and efficiently. Achieving reliability requires a careful selection of underlying algorithms and their faithful implementation in software.

Robustness is the ability of a program or a package to detect and gracefully recover from abnormal situations without terminating the computer run unless precise computational results cannot be achieved, and then with provision of appropriate default numerical results and precise diagnostic information.

Good structure requires that the logical flow be easily traced. The choice of variable names, format of source code, and comments contribute to structure as does the manner of amalgamating individual programs into a coherent package. NATS did not demand the formality of what has become known as "top-down structured programming" but adopted the spirit of that movement.

Usability describes the ease with which a user can choose a program and apply it to his problem. Documentation and calling sequences are basic to this attribute.

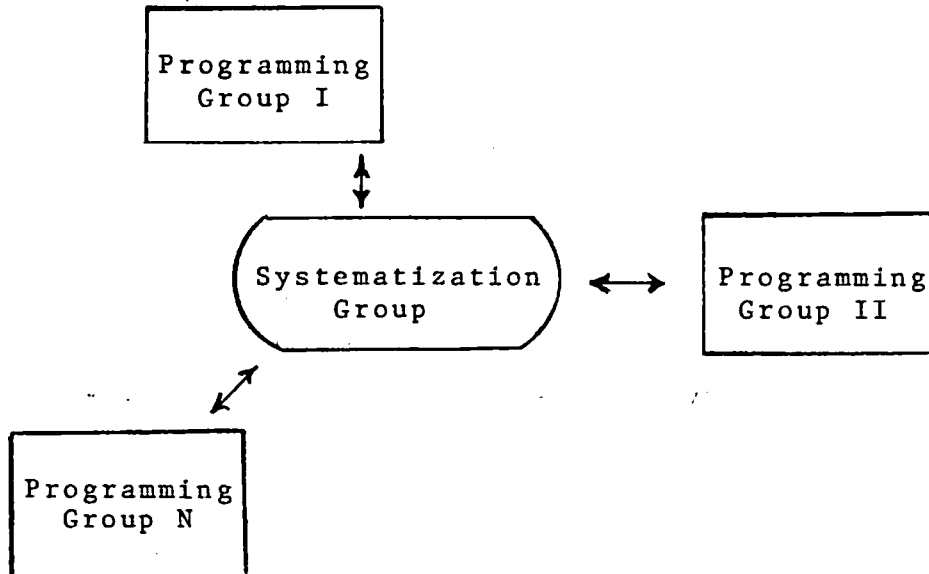

Validity refers to evidence of good performance as demonstrated by a testing process.

The systematized collections thus far released by NATS, namely EISPACK and FUNPACK, were derived from single sources and the people who actually wrote the Fortran, prepared the test materials, and coordinated the field testing worked in the same hallway. They correlated their efforts through regular project meetings and many informal conversations. Programming conventions and project procedures evolved and became part of the general understanding within the group. Ensuring that the individual routines possessed the above quality attributes was not separated from work that ensured that the collection possessed them. However, I believe that it is possible for work on individual routines to be physically separated from work on systematizing the collection of such routines provided certain agreements have been reached.

We must expect that the group as a whole shall have determined what routines are to be included in the collection. Moreover, the individual routines shall have been assigned to programming groups, most likely to the group which developed the routine in the first place. Further (assuming ANSI Fortran as the source language) the group as a whole must have agreed to conventions on calling sequences, data handling, formatting, naming of variables, and documentation.

Finally, a systematization group must be formed. The task of the programming groups is to ensure that the routines assigned to them have the quality attributes. The task of the systematization

group is to build a systematized collection using the given routines. The programming groups and the systematization group will follow the conventions determined by the whole group.

In carrying out its task, the systematization group would serve as the clearing-house for the entire effort. The job of assembling the pieces will require that group to remain in close contact with each programming group as the work progresses. The systematization group would be responsible for field testing (part of assuring validity) but each programming group would supply test cases for the routines in its assignment.

I think that funding for the activities of each programming group should be developed by that group. In particular, we at Argonne are interested in setting up a systematization group which would, in effect, be offering a service to the other groups who could then, hopefully, justify their activity in terms of incorporating their past efforts into a larger entity.

There is active planning underway which, we hope, will lead to a "mathematical software alliance". An ODE software effort would be an interesting prototype of the sort of thing an "alliance" would accomplish.

It would be a mistake to begin a job of this size unless we thought we had a reasonable chance to succeed. We may conclude that the time for an ODE software task force has not yet come. The success of the workshop as a forum does not depend on a positive decision to consort further in a structured way. But I believe that the idea is worthy of serious consideration and, if an organized effort toward a systematized ODE package appears feasible, we can make a beginning in June.

University of Toronto
Toronto, Ontario, Canada

Dear Tom:

The enclosed agenda is intended to be dynamic in the sense that the actual time spent on each topic will be determined by the course of the discussion. Frequent agenda reviews will enable us to allocate our time. Thursday afternoon and Friday morning will serve as buffers. I believe that each topic is essential and must be adequately covered. If your concerns are not subsumed under the listed topics, we will make necessary additions.

I have asked certain participants to make statements on various topics so as to provide a framework for well-informed discussion. Any participant is welcome and encouraged to make a statement at the beginning of the discussion of any topic. The chairpersons are people whose primary interest is not ODE software and whose task is to ensure that the discussions are conducted with reasonable order.

Again let me urge you to circulate reports, memoranda, and proposals to the participants. Please note that the name of Dr. David Sayers of Oxford has been added to the list. Also please note that I am herewith circulating a memorandum relevant to Topic VII.

Please return the enclosed housing and travel form as soon as your plans are definite.

We are looking forward to an exciting "ODE Week" at Argonne.

Cordially,

Wayne R. Cowell
Applied Mathematics Division
